

SUPPLEMENTARY MATERIAL

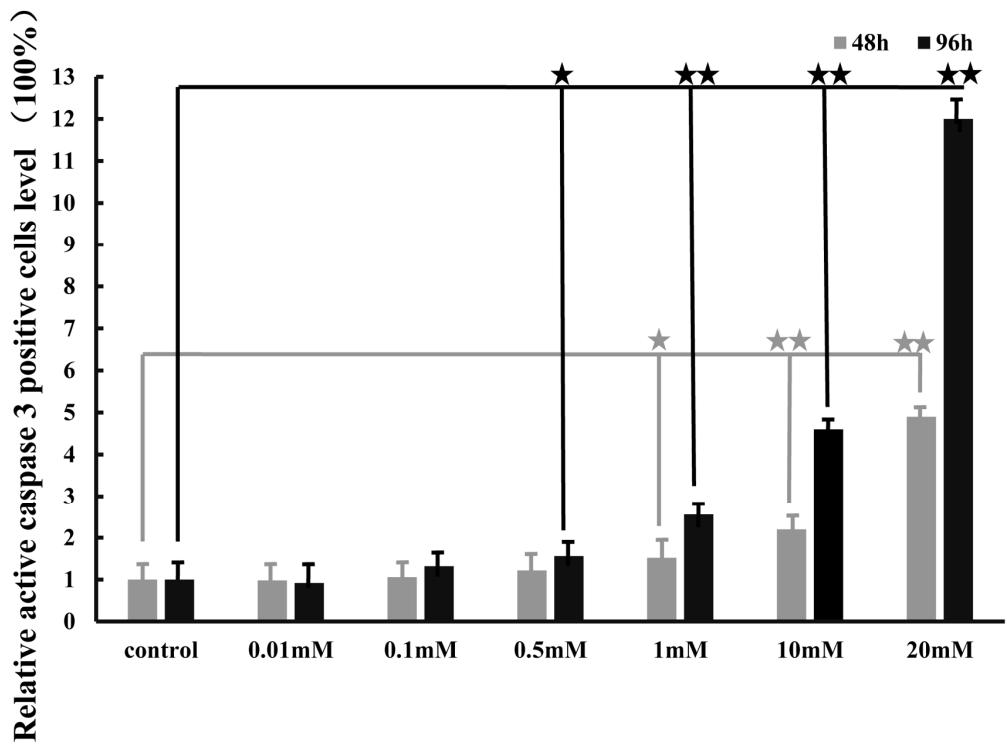

Supplementary Table S1. Fetal characteristics examined in this study.

Fetal characteristics (n=12)	Measurements
Age (weeks)	16.4±0.6
Weight (g)	126±8
Biparietal diameter (mm)	35.1±4.9
Femur length (mm)	22±4.2
Abdominal circumference (mm)	105.2±17.2
Fetal head circumference (mm)	123±9

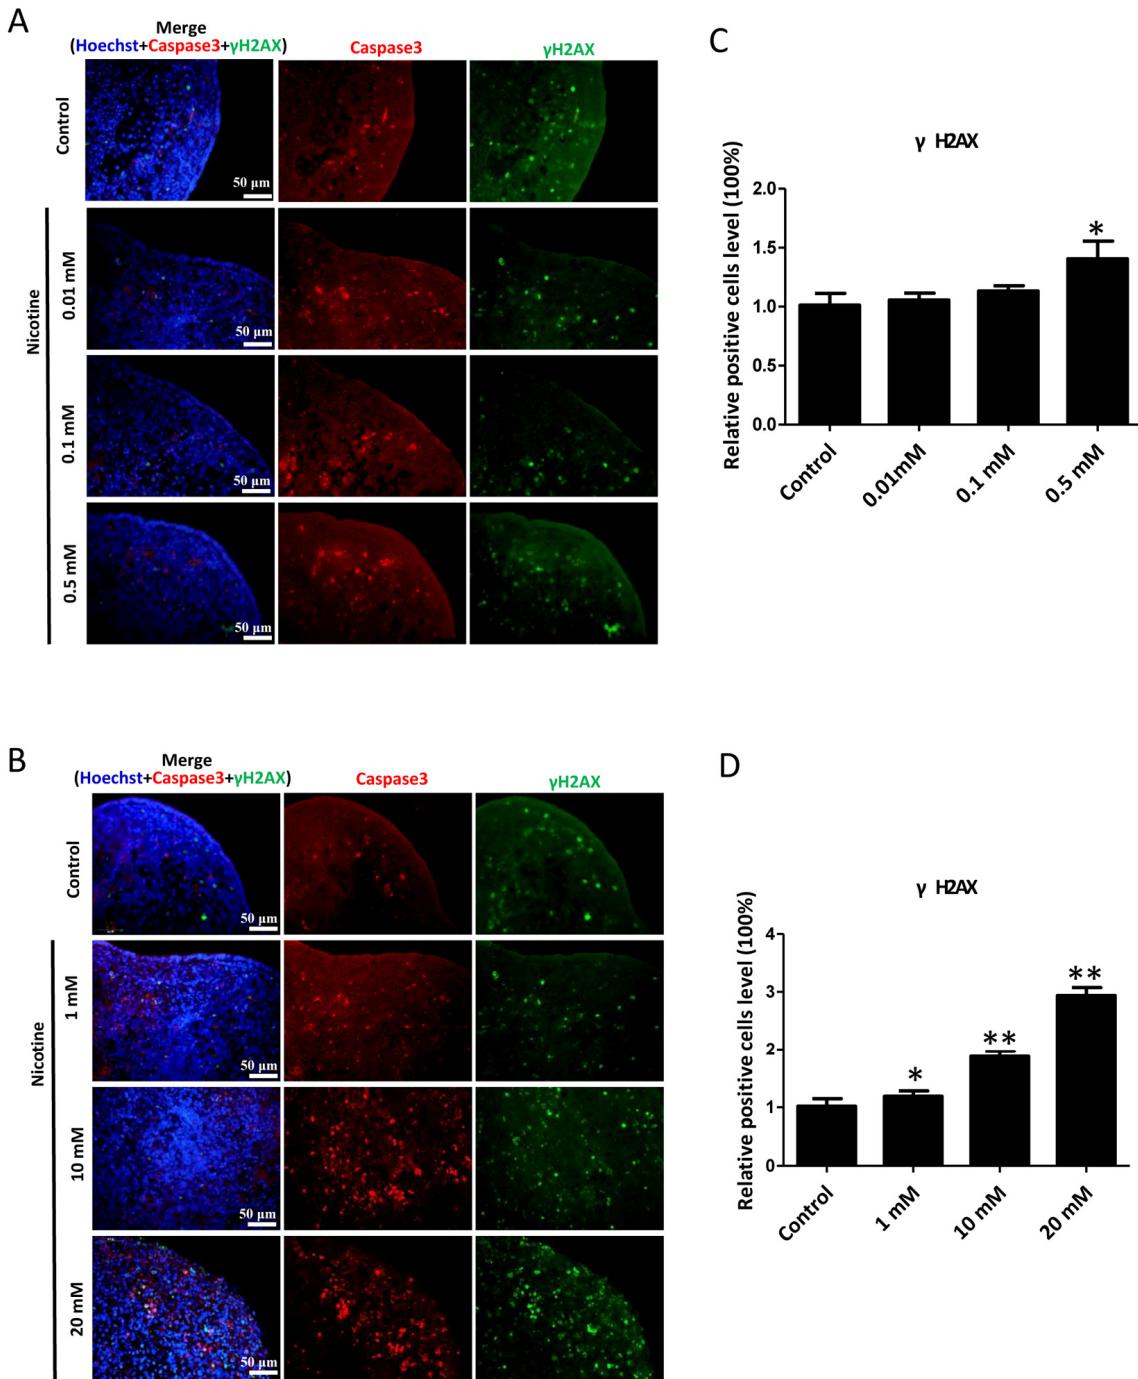

Supplementary Table S2. Primers Used for Quantitative Real-Time PCR.

Supplementary Figure S1. Relativer ration of Caspase3 positive cells in ovaries after 48 h or 96 h incubation in the presence of different concentrations of nicotine. Results are presented as the mean \pm SD. All experiments were repeated at least three times. (*) and (**) indicate significant ($P<0.05$) and highly significant ($P < 0.01$) difference, respectively.

Supplementary Figure S2. Representative IF images of tissue sections for active Caspase 3 and γ H2AX of ovaries cultured for 4 days (**A**) and 2 days (**B**) in the presence of increasing nicotine concentrations. (**C**) Relativer ration of γ H2AX positive cells after 4 days of culture; (**D**). Relativer ration of γ H2AX positive cells after 2 days of culture. All experiments were repeated at least three times. (*) and (**) indicate significant ($P < 0.05$) and highly significant ($P < 0.01$) difference, respectively.

Supplementary Figure S3. Representative IF images of tissue sections for VASA positive cells (germ cells) in human fetal ovaries cultured for 4 days (**A**) and 2 days (**B**) in the presence of increasing nicotine concentrations. (**C**) Relativer ration of VASA positive cells after 4 days of culture; (**D**) Relativer ration of VASA positive cells after 2 days of culture. All experiments were repeated at least three times. (*) and (**) indicate significant ($P<0.05$) and highly significant ($P<0.01$) difference, respectively.
