

SUPPLEMENTARY FIGURE

Supplementary Figure 1. Experimental approach. Both *in vitro* culture and *in vivo* pre-injection of iPSC-derived exosomes can restore dysfunctional endothelium. iPSC-derived exosomes can promote angiogenesis, promote the proliferation of BMCs, reduce the expression of p53 and p16, and improve tissue antioxidant capacity in some organs of aging mice. Moreover, iPSC-derived exosomes can repair damaged endothelial function, and improve endothelial cell angiogenesis.
