

SUPPLEMENTARY FIGURES

Supplementary Figure 1. A flow chart to obtain analytical data.

Supplementary Figure 2. Conditional DFS curves according to the number of years from treatment. Conditional survival (CS) curves according to the number of years after randomization. Traditional Kaplan-Meier estimates of CS (the starting point of the X axis = 0) overlaid by conditional CS estimates at 1yr (the starting point of the X axis = 1), 2yr (the starting point of the X axis = 2), 3yr (the starting point of the X axis = 3) and so on are shown from the time of randomization.
